 AB - EP--65207 Pigmented paint with low emission power in the spectral region of thermal radiation and in different colour properties contains 1-70 (3-30) wt.% metal pigment (I) with high electroconductivity. The paint is useful for solar collectors, for reducing energy losses from hot pipes, for reflecting heat from the walls behind heaters, for making, e.g. in IR test equipment, and as military IR camouflage paint. It combines low IR emission with the

other normal properties, e.g. shade, abrasion resistance, corrosion protection etc.

- Pref. (I) is in the form of rodlets, spheres or esp. flakes and consists of Zn, gold bronze, Sn or esp. Al. Its dimensions are 0.1-100 microns, with a large dia./thickness ratio flake and a large dia./length ratio for rodlets. Flakes with a dia. of 5-20 (10) microns are used for grey shades and with a dia. of 10-80 (40-50) microns for light shades, their thickness being 0.1-10 (1) microns.
